R For Data Science Cheat Sheet

xts

Learn R for data science Interactively at www.DataCamp.com

xts

eXtensible Time Series (xts) is a powerful package that provides an extensible time series class, enabling uniform handling of many R time series classes by extending zoo.

Load the package as follows:

> library(xts)

xts Objects

xts objects have three main components:

- coredata: always a matrix for xts objects, while it could also be a vector for zoo objects
- index: vector of any Date, POSIXct, chron, yearmon, yeargtr, or DateTime classes
- xtsAttributes: arbitrary attributes

Creating xts Objects

```
xts1 <- xts(x=1:10, order.by=Sys.Date()-1:10)
 data <- rnorm(5)
 dates <- seg(as.Date("2017-05-01"),length=5,by="days")
 xts2 <- xts(x=data, order.by=dates)</pre>
 xts3 <- xts(x=rnorm(10),
             order.by=as.POSIXct(Sys.Date()+1:10),
             born=as.POSIXct("1899-05-08"))
> xts4 <- xts(x=1:10, order.by=Sys.Date()+1:10)
```

Convert To And From xts

```
> data(AirPassengers)
> xts5 <- as.xts(AirPassengers)
```

Import From Files

Inspect Your Data

> index(xts1)

Class Attributes

> indexClass(xts2)

indexTZ(xts5)

Time Zones

tzone (xts1)

> core data <- coredata(xts2)

> indexFormat(xts5) <- "%Y-%m-%d"

tzone(xts1) <- "Asia/Hong Kong"

indexClass(convertIndex(xts, 'POSIXct'))

```
> dat <- read.csv(tmp file)
 xts(dat, order.by=as.Date(rownames(dat),"%m/%d/%Y"))
 dat zoo <- read.zoo(tmp file,
                        index.column=0.
                       sep=",",
format="%m/%d/%Y")
> dat zoo <- read.zoo(tmp,sep=",",FUN=as.yearmon)</pre>
> dat xts <- as.xts(dat zoo)
```

Export xts Objects

```
data xts <- as.xts(matrix)
tmp <- tempfile()
write.zoo(data xts, sep=", ", file=tmp)
```

Replace & Update

		Danie a control de la companya de la control
> xts2[dates] <-	. 0	Replace values in xts2 on dates with 0
> xts5["1961"] ·	- NA	Replace dates from 1961 with NA
> xts2["2016-05	02"] <- NA	Replace the value at 1 specific index with NA

Applying Functions

```
> ep1 <- endpoints(xts4,on="weeks",k=2)
                                                    Take index values by time
> ep2 <- endpoints(xts5,on="years")
[1] 0 12 24 36 48 60 72 84 96 108 120 132 144
> period.apply(xts5,INDEX=ep2,FUN=mean)
                                                    Calculate the yearly mean
> xts5 yearly <- split(xts5,f="years")
                                                    Split xts5 by year
                                                    Create a list of yearly means
> lapply(xts5 yearly, FUN=mean)
                                                    Find the last observation in
> do.call(rbind,
            lapply(split(xts5, "years"),
                                                    each year in xts5
           function(w) last(w, n="1 month")))
  do.call(rbind,
                                                    Calculate cumulative annual
            lapply(split(xts5, "years"),
                                                    passengers
           cumsum))
> rollapply(xts5, 3, sd)
                                                    Apply sd to rolling margins of xts5
```

Selecting, Subsetting & Indexing

Select

mar55 <- xts5["1955-03"]	Get value for March 1955
--------------------------	--------------------------

Subset

```
> xts5 1954 <- xts5["1954"]
                                                 Get all data from 1954
 xts5 janmarch <- xts5["1954/1954-03"]
                                                 Extract data from Jan to March '54
 xts5 janmarch <- xts5["/1954-03"]
                                                 Get all data until March '54
 xts4[ep1]
                                                 Subset xts4 using ep2
```

first() and last()

```
> first(xts4,'1 week')
                                                 Extract first 1 week
first(last(xts4,'1 week'),'3 days')
                                                 Get first 3 days of the last week of data
```

Indexing

Extract core data of objects

Extract index of objects

Get index class

Get index class

Replacing index class

Change the time zone

Change format of time display

Extract the current time zone

>	xts2[index(xts3)]	Extract rows with the index of xts3	
>	days <- c("2017-05-03","2017-05-23")		
>	xts3[days]	Extract rows using the vector days	
>	xts2[as.POSIXct(days,tz="UTC")]	Extract rows using days as POSIXct	
>	<pre>index <- which(.indexwday(xts1)==0 .indexwday(xts1)==6)</pre>	Index of weekend days	
>	xts1[index]	Extract weekend days of xts1	

Periods, Periodicity & Timestamps

```
periodicity(xts5)
                                      Estimate frequency of observations
                                      Convert xts5 to yearly OHLC
to.yearly(xts5)
                                      Convert xts3 to monthly OHLC
to.monthly(xts3)
to.guarterly(xts5)
                                      Convert xts5 to quarterly OHLC
                                      Convert to quarterly OHLC
to.period(xts5,period="quarters")
to.period(xts5,period="years")
                                      Convert to yearly OHLC
nmonths (xts5)
                                      Count the months in xts5
nquarters (xts5)
                                      Count the quarters in xts5
nvears(xts5)
                                      Count the years in xts5
make.index.unique(xts3,eps=1e-4)
                                      Make index unique
make.index.unique(xts3.drop=TRUE)
                                     Remove duplicate times
align.time(xts3, n=3600)
                                      Round index time to the next n seconds
```

Missing Values na.omit(xts5)

```
xts last <- na.locf(xts2)
                                              Fill missing values in xts2 using
                                              last observation
xts last <- na.locf(xts2,
                                              Fill missing values in xts2 using
                          fromLast=TRUE)
                                              next observation
                                              Interpolate NAs using linear
na.approx(xts2)
                                              approximation
```

Omit NA values in xts5

Arithmetic Operations

coredata()Or as.numeric()

	<pre>xts3 + as.numeric(xts2) xts3 * as.numeric(xts4)</pre>	Addition Multiplication
>	coredata(xts4) - xts3	Subtraction
>	coredata(xts4) / xts3	Division

Shifting Index Values

	> xts5 - lag(xts5)	Period-over-period differences
1	<pre>> diff(xts5,lag=12,differences=1)</pre>	Lagged differences

Reindexing

> xts1 + merge(xts2,index(xts1),fill=0)	Addition
e1 2017-05-04 5.231538 2017-05-05 5.829257 2017-05-06 4.00000 2017-05-07 3.000000 2017-05-08 2.000000 2017-05-09 1.000000	
> xts1 - merge(xts2,index(xts1),fill=na.locf) e1 2017-05-04 5.231538	Subtraction
2017-05-05 5.829257 2017-05-06 4.829257 2017-05-07 3.829257 2017-05-08 2.829257	
2017-05-09 1.829257	

Merging

```
merge(xts2,xts1,join='inner')
                                            Inner join of xts2 and xts1
                 xts2 xts1
2017-05-05 -0.8382068
merge(xts2,xts1,join='left',fill=0)
                                            Left join of xts2 and xts1,
                                            fill empty spots with 0
          xts2 xts1
 rbind(xts1, xts4)
                                            Combine xts1 and xts4 by
```

Other Useful Functions		
> .index(xts4)	Extract raw numeric index of xts1	
> .index(xts4)	Value of week(day), starting on Sunda	
:Indexwday(xts3)	in index of xts3	
> .indexhour(xts3)	Value of hour in index of xts3	
> start(xts3)	Extract first observation of xts3	
> end(xts4)	Extract last observation of xts4	
> str(xts3)	Display structure of xts3	
> time(xts1)	Extract raw numeric index of xts1	
> head(xts2)	First part of xts2	
> tail(xts2)	Last part of xts2
